ReleaseNotes42

Release Notes

Installation

When installing Tiki 4.0 with PHP 5.1.0 (or higher), you may encounter a **System error: could not find driver** message. This indicates that PDO driver for your database has not been enabled on your server.

To enable the driver:

- For Unix:
  Refer to http://us.php.net/manual/en/book.pdo.php] for information on installing PDO support.
  As an alternative, add the following statement to the end of your **../db/local.php** file, before the **?>** :

```
$api_tiki='adodb';
```

- For Windows:
  Add the following statement to your php.ini file:

```
extension=php_pdo_mysql.dll
```

Upgrade

You can upgrade your 1.9.x, 2.x, 3.x, or 4.x Tiki directly to this release by using the Tiki Installer. See http://doc.tiki.org/Upgrade

In this Release
