

The Problem

If you want to use an RSS Stream from your own htAccessed page, you cannot simply set the URL, because php simply opens the RSS Stream as your Browser does with this Website or any other HTML. So when php tries to open it, it fails, because there is no authentication.

The Solution

Simply enter your user / password into the URL. The Form for this is:

> http://user:pass@www.site.de/tiki_blog-rss.php

In Theory this should be enough, but on my own site I still faced problems.
(See next Title)

RDF Problems

It seems that the RDF's generated by Tiki are not Standard conform. [Validator](#)

FIXED UserPageohertel

Update:

After a close look into the output, I realised that there was a little Warning Message in the RDF ! (Generated by PHP). This was the problem why nothing got displayed.

So after removing the causing Line from tiki-setup.php everything works fine with the above user:pass combination.

(Line 1418)

```
if($feature_obzip == 'y') {  
// ob_start("ob_gzhandler");  
}
```

You can also simply disable gzip compressed pages, like described in [Making a PHP summary from Tiki RSS](#)

I hope you like this, let me know.
