

XhtmlCssValidate

Right now we display w3c buttons, but there are some recent changes that may break the validation.

Tools for Validation

<http://placenamehere.com/pnhtoolbar/> for Mozilla, install as root run as user.

CSS Validation

<http://jigsaw.w3.org/css-validator/validator-uri.html>

Some tips:

- use background-color rather than background
- use transparent rather than none
- use hexadecimal colors (unless for black and white that are obvious)

For version 1.8.3 all CSS were checked and validated with W3C CSS validator, for version 1.9 some problems have been detected by the W3C CSS validator:

Invalid

<http://tikiwiki.org/styles/moreneat.css> (checked with valid XHTML)

XHTML Validation

Tests are done on website tikiwiki.org, using W3C validator <http://validator.w3.org> . That list is not finished please help if you have 15 minutes to kill, get a page that is public, click on xhtml button at the bottom, and add the page to the list. If you can fix what makes it invalid, it's better even 😊

Invalid

Warnings

[XhtmlCssValidate](#) (character "&" is the first character of a delimiter but occurred as data)

Notes

- I had to remove enable_trans_sid in apache. The &PHPSESSID=xxx is a problem with ampersand (&) that should be encoded (&)
- what can we do for ampersands present in the body of text ?
- <http://www.htmlhelp.com/cgi-bin/validate.cgi?url=http%3A%2F%2Ftikiwiki.org%2F&warnings=yes&spider=yes> impressive debug : great bug hunt to do.

Fixed

- The Online Users Module has made all pages showing it invalid
