

General Description

Build a PDF of a wiki page.

Activation

With administrative privileges click Admin, then click the Wiki icon. Check the appropriate checkbox for PDF Generation and save your changes.

Requirements for PDF generation

This is a important feature for Wiki. We need to add a list of things required for PDF generation.

1. Enable php-xml extension (e.g. by installing php-xml package for your Linux distribution and enabling `extension = xml.so` in your php.ini file; please note that in PHP for Windows it's enabled by default).
2. Enable php-pdf extension in your php.ini file. *IMHO php-pdf is not required* "luci
3. Please add other (PDF extra).

Key Function and sub-features

Related Links

- Uses the R&OS PDF class <http://www.ros.co.nz/pdf/>
- FPDF is also a good PDF generation library, and under a 'do whatever you want' type of library. <http://www.fpdf.org>

Typical Uses

- Export of hardprintable material
- Interoperability

Case Studies

- make sure your servernames etc are set correctly on admin->general too, otherwise imgs fail.
- ok, checking thanks... servername in general - you mean the "Use URI as Home Page" setting?
- nope, underneath those options
- or just "server name" down below... ok, does it need to be the full URI (<http://...>) or just the hostname?
- just the name
